National Heat Treat Opens New Facility

May 29, 2013

National Heat Treat (NHT) recently celebrated the official opening of a key facility in Houston, Texas. The event showcased NHT's state-of-the-art, 50,000-square-foot, thermal-processing plant and infrastructure, which includes one of the largest commercial vacuum furnaces in the southwest U.S. The new Houston facility also houses the highest-operating-temperature commercial open-fire furnace in Texas. July 2013 – the second phase of expansion – will bring the largest commercial batch furnace in Texas. The next two phases will be completed over the next 12 months and involve additional investments in technology and equipment. NHT is a privately held firm that provides proprietary heat-treat and testing services for a variety of metals and applications.
